

2024 VILLAGE OF CONCORD ANNUAL WATER QUALITY REPORT

The Village of Concord strives to produce the best quality drinking water possible. The purpose of this report is to provide you with information about your drinking water. The report explains to you where your water comes from. The report also lists all of the contaminants detected in your water and an explanation of any violations in the past year.

Your drinking water comes from four groundwater wells located in the Village of Concord. Well #1 is 107 feet deep; well #3 is 270 feet deep and well #4 is 266 feet deep. Each of these wells draws water from the Upper Grand River watershed. The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. The State performed an assessment of our source water in 2003 to determine the susceptibility or the relative potential of contamination. The susceptibility rating is on a seven-tiered scale from “very-low” to “very-high” based primarily on geologic sensitivity, water chemistry and contaminant sources. The susceptibility of our source is “high.” There are no known potential contamination sources within the Village’s standard isolation area for the wells. The Village’s water is obtained from an aquifer that is characterized as “unconfined.” Unconfined aquifers are characterized geologically as “sensitive.” We have completed the Jackson County Wellhead Protection Program and have capped all abandon wells in our aquifer.

In 2020 the Village of Concord started the water main replacement project with a loan/grant obtained through the USDA. The project was completed in December 2021. The project eliminated all the aging and under sized cast iron water main with larger plastic (PVC) water main, by doing so it has eliminated water main breaks and increase water quality. The life expectancy of PVC water main is 100 years.

Since July 27, 2006 we have been disinfecting our water with chlorine, based on the recommendation from the EGLE. To ensure quality drinking water we try to hold a residual of two tenths (0.2) in the distribution system.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about the contaminants and potential health effects can be obtained by calling the EPA’s Safe Drinking Water Hotline at 1-800-426-4791 or the State of Michigan Department of Environment, Great Lakes, and Energy at 1-517-780-7840.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of the infection of *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791.

While your drinking water meets the U.S. EPA standard for arsenic, it does contain low levels of arsenic. The U.S. EPA standard balances the current understanding of arsenic’s possible health effects against the costs of removing arsenic from drinking water. The U.S. EPA continues to research the health effects of low levels of arsenic, which is a mineral known to cause cancer in humans at high concentrations and is linked to other health effects such as skin damage and circulatory problems.

Lead can cause serious health effects in people of all ages, especially pregnant people, infants (both formula-fed and breastfed), and young children. Lead in drinking water is primarily from materials and parts used in service lines and in home plumbing. The Village of Concord is responsible for providing high quality drinking water and removing lead pipes but cannot control the variety of materials used in the plumbing in your home. Because lead levels may vary over time, lead exposure is possible even when your tap sampling results do not detect lead at one point in time. You can help protect yourself and your family by identifying and removing lead materials within your home plumbing and taking steps to reduce your family’s risk. Using a filter, certified by an American National Standards Institute accredited certifier to reduce lead, is effective in reducing lead exposures. Follow the instructions provided with the filter to ensure the filter is used properly. Use only cold water for drinking, cooking, and making baby formula. Boiling water does not remove lead from water. Before

using tap water for drinking, cooking, or making baby formula, flush your pipes for several minutes. You can do this by running your tap, taking a shower, doing laundry or a load of dishes. If you have a lead service line or galvanized requiring replacement service line, you may need to flush your pipes for at least 5 minutes to flush water from both your home plumbing and the lead service line. If you are concerned about lead in your water and wish to have your water tested, contact the Village of Concord at 517-524-8534 for available resources. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available at <https://www.epa.gov/safewater/lead>.

The Village of Concord's water supply comes from groundwater. As water travels through the ground, it dissolves naturally occurring minerals and can pick up substances resulting from the presence of animals or from human activity. These include:

- * Microbial contaminants, such as viruses and bacterial, which may come from sewage treatment plants, septic systems, livestock and wildlife.
- * Inorganic contaminants, such as salts and metals, which can be natural or may result from storm runoff, wastewater discharges, oil and gas production and farming.
- * Organic chemicals, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also originate from gas stations, storm runoff and septic systems.
- * Radioactive substances, which can be naturally occurring or be the result of oil and gas production and mining activities.
- * Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses.

In order to ensure that tap water is safe, the U.S. Environmental Protection Agency (EPA) prescribes regulations which limit the amount of certain contaminants in water provided by public water systems.

2024 WATER QUALITY DATA

Each year, the Village is required to sample the drinking water for various contaminants. The table below lists all contaminants that were detected in 2024. The state allows us to monitor for certain contaminants less than annually because the concentrations of these contaminants are not expected to change frequently. The most recent results of these tests are included in the table. All violations are printed in **bold**, and an explanation of any violation is provided.

Terms and Abbreviations:

- * **Maximum Contaminant Level (MCL):** The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as possible using the best available treatment technology.
- * **Maximum Contaminant Level Goal (MCLG):** The level of a contaminant in drinking water below which there is not a known or expected health risk.
- * **Maximum Residual Disinfection Level (MRDL):** The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contamination.
- * **Maximum Residual Disinfection Level Goal (MRDLG):** The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
- * **Action Level (AC):** The concentration of a contaminant which, when exceeded, triggers treatment or other requirements, which a water system must follow.
- * **pCi/L:** picocuries per liter
- * **N/A:** not applicable
- * **ND:** not detected
- * **ppb:** parts per billion or micrograms per liter (*ug/L*)
- * **ppm:** parts per million or milligrams per liter (*mg/L*)

Contaminant	MCL	MCLG	Concord's Water	Range of Detections	Sample Date	Violation	Typical Source of Contaminant
-------------	-----	------	-----------------	---------------------	-------------	-----------	-------------------------------

Inorganic Contaminants

Arsenic (ppb)*	10	0	7.3	6.2 -7.3	08/08/24	None	Erosion of natural deposits
Fluoride (ppm)	4	4	<0.10	<0.10-<0.10	08/08/24	None	Erosion of natural deposits
Nitrate (ppm)	10	10	0.98	<0.29-0.98	08/08/24	None	Run off from fertilizer use

*Some people who drink water containing arsenic in excess of the MCL over many years could experience skin damage or problems with their circulatory system, and may have an increased risk of getting cancer.

Unregulated Inorganic Contaminants¹

Chloride (ppm)	N/A	N/A	36	31-36	08/08/24	None	Natural in ground water
Hardness (ppm)	N/A	N/A	370	330-370	08/08/24	None	Natural in ground water
Iron (ppm)	N/A	N/A	0.87	0.38-0.87	08/08/24	None	Natural in ground water
Sodium (ppm)	N/A	N/A	14	12-14	08/08/24	None	Natural in ground water
Sulfate (ppm)	N/A	N/A	33	15-33	08/08/24	None	Natural in ground water

Contaminant	MCL	MCLG	Concord's Water	Range of Detections	Sample Date	Violation	Typical Source of Contaminant
-------------	-----	------	-----------------	---------------------	-------------	-----------	-------------------------------

Disinfection Byproduct Monitoring

Total Trihalomethane (ppb)	80	N/A	2.8	N/A	08/08/24	None	Chlorine byproduct
Haloacetic Acids (ppb)	60	N/A	<1.0	N/A	08/08/24	None	Chlorine byproduct

Microbial Contamination

Total Coliforms	0	N/A	0 samples showed detections	N/A	2024	None	Naturally present in the environment
-----------------	---	-----	-----------------------------	-----	------	------	--------------------------------------

Contaminant	MCL	MCLG	Concord's Water	Range of Detections	Sample Date	Number of Samples above Action Level	Typical Source of Contaminant
-------------	-----	------	-----------------	---------------------	-------------	--------------------------------------	-------------------------------

Lead and Copper Monitoring at Consumer's Tap²

Lead (ppb)	AL=15	0	2	0 - 4 ppb	07/27/23	0 out of 10 sites above action level	Lead service lines, corrosion of household plumbing including fittings and fixtures; Erosion of natural deposits
Copper (ppm)	AL=1.3	1.3	0.14	0.1 – 0.2 ppm	07/27/23	0 out of 10 sites above action level	Corrosion of household plumbing systems; Erosion of natural deposits

1. There are no MCL's associated with unregulated contaminants. Monitoring of unregulated contaminants helps the EPA to determine whether there is a need to regulate these contaminants.

2. Lead and Copper results lists the number of samples that exceeded the action level, rather than the range detected.

The Village of Concord had NO violations in 2024.

The village of Concord water is in compliance with all Federal and State requirements of the Safe Drinking Water Act.

The CCR will not be mailed. A copy can be picked up at the village office.

If you would like more information about your water, please call DPW Director Jason Blossom at the Village Office at 517-524-8534 or by mail at P.O. Box 306 Concord, Michigan 49237 or by e-mail at office@villageofconcord.com. The Village's website is: villageofconcord.com.

The Village Council of Concord meets at 7:00 PM on the second Tuesday of each month, in the Village Office at 110 Hanover Street. Please feel free to come and participate.
